Inhalator anaesthesia versus ATIV is a good question? In anaesthetics practice there are much particulars situations which born more and more questions. Which method is better?

This is the attitude and which are the factors who should be taken into consideration in choosing one of more techniques of anaesthesia and which are the objective factors who can influence the decisions. We can use which anaesthesia is better and how we can decide this.

In practice is very important how we realize the best monitoring which allows a better control to depth or awareness situation.
