

## **ENDOTHELIAL CONTROL OF HIPER-COAGULATION IN ACUTE CORONARY SYNDROMES**

Prof. **Mariana Rădoi** MD PhD, junior assist **Mirela Nan** MD  
Faculty of Medicine, University „Transilvania” Braşov

Antithrombotic therapy is an essential component of the management of patients with acute coronary syndromes. Combining antiplatelet therapy in the form of low-dose aspirin with the vitamin K antagonists, can be beneficial for the prevention of recurrent thrombotic events when moderate-intensity anticoagulation (INR 2-3) is achieved, although the limitations of current agents make their use far from ideal.
