*We made a retrospective study of the treatment efficacy in children with tuberculosis (TB) treated in the hospital for phtysiology in 1990-1993 with therapeutic regimes which can not be classified like standards. The therapeutic method was efficacy in all forms of TB and independent of the rhythms of administration and it has not produce adverse reactions to the medicines. The correct treatment with medicine in efficient doses and rhythms, under the direct observation, on status with socioeconomic real measures can prevent TB in adults.*
